SCOPE OF WORK

Servoshakti FieldForce

Multi-Company OEM, Warranty & Field-Service Partner Network Platform

■ PROJECT OBJECTIVE

A unified service ecosystem connecting OEMs, service companies/vendors, engineers and customers for warranty-linked service requests, field execution, digital proof, closure, reporting and settlements.

CLIENT / COMPANY DETAILS

Company	Servoshakti Power Service LLP
Address	45 B Mitrabandhu Nagar, Kanadiya Road, Indore (M.P.) 452016
Phone	7004356247
GSTIN	23ADXFS6542D1ZS
ARN Number	AD230222008818D
Client contact shown on scope	7004356247

■ SOLUTION STRUCTURE

Phase 1: FieldForce Network & field-service operations. Phase 1B: AI Complaint Assistant, designed as an AI-ready extension with a clearly separated workflow.

Prepared by

Ravi Tiwari | Sales Manager | Appzeto
+91 7898755145 | ravitiwari@appzeto.com | www.appzeto.com
501, 5th Floor, Princess Center, New Palasia, Indore, Madhya Pradesh

01 | Platform Components & Core Roles

The platform is designed as a multi-company ecosystem. Data visibility, access and operational rules are controlled by role and company.

COMPONENT	PRIMARY FUNCTION
OEM / Manufacturer Panel	Products, warranty, service requests, vendor authorization, TAT/SLA and MIS.
Vendor / Service Company Panel	Company KYC, engineer management, service areas, local jobs and outside-location partner requests.
Engineer Mobile App	Job acceptance, day start, field execution, GPS, photos, serial/readings, customer confirmation and eFSR.
Customer Module	Product passport, equipment registration, AI-assisted complaint intake, service tracking, history and closure confirmation.
Servoshakti Admin / Control Tower	Approvals, matching, warranty, quality, disputes, payouts, rate cards, escalation and company-wise reporting.
Backend / API / Database	Shared service records, role-based access, multi-company separation, audit logs and workflow engine.

→ CORE ECOSYSTEM

OEM / Manufacturer → Vendor / Service Company → Engineer → Customer → Service Closure → Warranty / Billing / Settlement

02 | OEM / Manufacturer Panel

- OEM/company profile management and authorized vendor/service partner onboarding.
- Product, equipment, model, brand and service-category master management.
- Warranty number, purchase date, warranty period, eligibility and status management.
- Create and track service requests against products/equipment and customers.
- Route calls to authorized vendors/service partners using brand, city, skill and certification rules.
- Monitor TAT/SLA, service status, escalations, repeat visits and closure evidence.
- Review/approve service closure and access service history, MIS, vendor performance and company-wise reports.
- Configure brand-specific rate cards for PM, breakdown, installation, warranty and non-warranty work.

03 | Vendor / Service Company Owner Panel

- Register a service company by legal/company name, address, service area, KYC documents, GST/tax details where applicable and authorized brands.
- Add, edit, deactivate and manage company engineers, their skills, certifications, availability and service territories.
- Assign local calls received by the company to its own engineers.
- Request an outside-location partner company or independent engineer when local capacity is unavailable.
- Clearly distinguish own-company calls, platform-assigned calls, outsourced calls and partner-company calls.
- Track call status, engineer location, eFSR, quality, call-wise payout and settlement.
- View engineer performance, attendance/day status, approved calls, rejected/repeat calls, earnings and payment disputes.
- Request reassignment/escalation and track outsourced job completion and accountability.

■ COMPANY OWNER WORKFLOW

Owner registers the company → adds engineers → receives/assigns local calls → requests external coverage for other cities → monitors service evidence, approval, engineer payout and company settlement.

04 | Engineer Mobile App & Servoshakti Tracker Rules

• Engineer registration, KYC, skills, certifications, brand authorization, availability and profile status.

• Receive, accept or reject service calls; show acceptance deadline and assignment status.

• Day Start is compulsory before the engineer can begin eligible field-service activity.

• No manual End Day button: the system automatically closes the engineer day at 11:59 PM IST.

• Engineer can view only their own assigned calls, work history, service evidence, day status, approved call count and payment status.

• Engineer manually enters CRM/SR reference and call details where required by the Servoshakti process.

• GPS check-in, location validation and distance calculation are recorded for the service visit.

• Capture equipment serial number, readings, work performed, remarks and before/after photographs.

• Customer OTP and/or signature is required for service closure according to configured job policy.

• Completed calls require report/photo evidence and eFSR submission.

• Admin/OEM/vendor verification is required before a call becomes eligible for payment approval.

• QG/Fuji report generation is not part of this platform scope; the existing system remains the record for those reports.

■ ENGINEER DATA PRIVACY

An engineer must not see another engineer's private call details, customer records, performance or payouts unless explicitly authorized through a defined supervisory role.

05 | Engineer Incentives, Recharge & Payout Rules

RULE	REQUIRED SYSTEM BEHAVIOUR
Monthly call eligibility	Track a minimum of 5 approved calls per engineer per month.
Free mobile recharge	When the engineer meets the 5-approved-call threshold, mark eligibility for a free 28-day mobile recharge.
Recharge timing	Configure the actual issue date/process with Servoshakti: month-end, next-month cycle or after approval. This policy requires client confirmation.
Inactive engineer	Track active/inactive status and apply the client-approved eligibility rule if an engineer becomes inactive during the month.
Call-basis payment	Maintain call-wise payout records with rate, approval state, payment status and transaction history.
Engineer type	Apply separate payout rules for independent engineers and company-employed engineers.
Failed/rejected/repeat call	Record reason and approval outcome; payment eligibility follows a configurable policy confirmed by Servoshakti.
Disputes	Allow authorized users to raise, review, approve/reject and audit payment disputes.

! POLICY CONFIRMATION NEEDED

The minimum 5 approved calls/month and 28-day recharge eligibility are included as requested. Exact recharge timing, inactive-month treatment, and payout treatment for failed/rejected/repeat calls must be confirmed before build sign-off.

06 | Customer Module & Product Passport

• Customer registration/login and profile, contact details and service address.

• Create a product passport after purchase with product brand, model, serial number, invoice, purchase date, warranty start/end and supporting document/image.

• Validate required fields and allow customers to review/edit details before saving.

• Show product/service history, warranty status, active complaints, service visits and closure evidence.

• Allow a customer to initiate an AI-assisted complaint by text or voice, or use the standard manual service-request flow.

• Customer can track complaint/SR number, status, assigned service company/engineer, expected TAT and updates.

• Capture customer OTP/signature and feedback where required at service closure.

• Send configurable warranty-expiry reminders and service updates through enabled communication channels.

07 | AI Customer-Care Complaint Assistant (Phase 1B)

This is a distinct workflow from field-service execution. The AI assistant helps a customer register a complaint with the relevant brand/OEM customer-care team and captures the reference details before any field-service dispatch, where applicable.

STEP	FUNCTIONAL REQUIREMENT
1. Product passport	Customer selects a registered product or adds invoice, serial number, model, purchase date and warranty details.
2. AI intake	Customer describes the problem by text or voice; AI transcribes where applicable and creates a concise complaint summary.
3. Customer confirmation	Show the complaint summary and ask the customer to confirm/edit before submission or outbound call.
4. AI brand call	AI calling service contacts the brand’s customer-care number, follows the configured call script and requests complaint registration.
5. SR number and TAT	Capture service request/reference number, expected turnaround time, relevant notes and call outcome.
6. Human handoff	If the customer wants to speak to an executive, attempt a live call bridge/three-way connection where technically supported and consented to.
7. Transcript/recording	Store call outcome and, where lawful and consented, transcript/recording with access control and retention policy.
8. Failure fallback	If AI call fails, queue retry, offer human/operator fallback, record failure reason and escalate based on configured rules.
9. Follow-up	Schedule automatic follow-up/escalation when the SR is missing, TAT is exceeded or the brand has not updated the complaint.
10. Warranty reminders	Send reminders before product warranty expiry using the customer’s saved product passport.

AI CALLING SAFEGUARDS

AI calling, recording, transcription, call bridging and third-party voice services depend on provider capability, customer consent, applicable law and provider charges. These integrations must be selected and validated before production.

08 | Two Separate Workflows

Workflow A — AI Complaint Assistance

CUSTOMER	AI ASSISTANT	BRAND CUSTOMER CARE
Select product passport; describe issue by text/voice.	Summarize issue; obtain customer confirmation; place permitted call.	Register complaint and provide SR/reference + expected TAT.
↓	↓	↓
Track complaint and approve summary.	Save call outcome; retry/escalate or hand off to human.	Follow up until status/next step is recorded.

Workflow B — Field-Service Execution

OEM / VENDOR	DISPATCH ENGINE	ENGINEER
Create/receive work order; confirm warranty and service eligibility.	Match by priority, skills, location, availability and rate card.	Accept job, Day Start, visit site and capture GPS/evidence.
↓	↓	↓
Review eFSR and service closure.	Apply QA/SLA rules and route exceptions.	Collect customer OTP/signature; submit eFSR.
↓	**APPROVAL & SETTLEMENT**	↓
Company-wise billing / MIS.	Approve call and vendor/engineer payout.	Payment status visible to eligible user.

↔ ARCHITECTURE REQUIREMENT

Keep complaint registration/call orchestration separate from field-service work orders, while linking them through customer, product passport and SR references. AI should be Phase 1B if not launched initially, but the data model and APIs should be AI-ready from Phase 1.

09 | Exact Dispatch & Reassignment Rules

PRIORITY	ASSIGNMENT OPTION	RULE
1	Same company, local engineer	Prefer an available, qualified engineer from the assigned service company in the service area.
2	Same-city independent engineer	If own team capacity is unavailable, consider an eligible independent engineer in the same city.
3	Nearby partner company	If still unavailable, request an authorized nearby partner company with matching capability.
4	Backup/emergency partner	Use designated backup/emergency coverage before SLA/TAT risk becomes critical.

- Configure maximum service radius by city, service category or OEM/vendor policy.
- Configure acceptance window; proposed default is 10 minutes, subject to client approval.
- If no acceptance occurs within the configured window, automatically move to the next eligible candidate and record the reason.
- Use SLA/TAT risk alerts and escalation before deadlines are breached.
- Respect engineer availability, day-off, active/inactive status and current workload.
- Match required brand certification, equipment skill, tools/parts capability and service category.
- Log every dispatch decision, rejected offer, timeout, reassignment and override.

■ MATCHING RULE

Matching must not assign a job solely by distance. Brand certification, skills, availability, radius, service capability and OEM/vendor authorization must also pass.

10 | Service Request, Warranty & Closure Lifecycle

STAGE	WORKFLOW
1	Product passport / warranty record is registered or located.
2	Customer or OEM creates a service request; AI complaint reference may be linked if applicable.
3	Warranty, service eligibility, priority and rate-card category are verified.
4	Vendor/service company and engineer are assigned according to dispatch rules.
5	Engineer completes Day Start, accepts the call and visits the site.
6	GPS, distance, serial number, readings, photos, work notes and service evidence are captured.
7	Customer OTP/signature is captured; engineer submits report and eFSR.
8	Authorized admin/OEM/vendor reviews evidence, quality and closure status.
9	Approved call becomes eligible for applicable billing, incentive and payout rules.
10	Service history, reports, company-wise MIS and settlement ledger are updated.

11 | Rate Cards, Billing & Company-Wise Settlement

• Maintain a separate rate card for each OEM/company; the platform must not assume one universal rate card.

• Support brand-wise rates for preventive maintenance (PM), breakdown, installation and other configured job types.

• Support distance slabs and approved GPS/distance calculation rules.

• Distinguish warranty and non-warranty service rates.

• Store separate vendor payout, engineer payout and platform/service fee for each applicable call.

• Support different rates for the same engineer working under different OEMs/companies.

• Maintain call-wise rate snapshots so later rate-card changes do not silently rewrite historical settlements.

• Support company-wise invoice/MIS, P&L; visibility, settlement status and exportable reports.

• Provide configurable GST/tax fields and tax-reporting treatment according to the client's approved accounting process; final tax configuration requires client/accountant confirmation.

• Payment gateway/UPI integrations can be used where required; all transactions should have references, status and audit history.

■ BILLING CONTROL

Payout approval should depend on approved service closure/eFSR and the applicable company rate card. Failed, rejected, duplicate and repeat calls must follow separately configured payment rules.

12 | Smart Matching, OEM–Vendor Bridge & Control Tower

Smart Matching & OEM–Vendor Bridge

• Onboard OEMs/vendors and manage authorization, brand, product, service category and service-area mapping.

• Route warranty and non-warranty service work to authorized vendors and support outside-location requests.

• Track vendor performance, service history, job status and cross-location execution.

• Use location, equipment type, brand certification, skill, availability, radius and performance to match work.

Servoshakti Admin / Control Tower

• Manage OEMs, service companies, engineers, customers and partner relationships.

• Verify KYC, documents, certifications and authorization status.

• Monitor calls, matching, assignment, reassignment, escalations and service closure.

• Configure warranty, rate cards, service categories, radius, SLA/TAT, acceptance window and business rules.

• Monitor quality: TAT, first-time-fix, repeat complaints, ratings, customer approval and evidence completeness.

• Manage disputes, exceptions, wallet/recharge, payments, payouts and settlements.

• Access company-wise and city-wise MIS, service volume, warranty, SLA, payments, quality and P&L; reports.

13 | Notifications, Reports & Audit

REPORT / ALERT	INFORMATION
OEM reports	Warranty status, service volume, TAT, SLA breaches, vendor performance and closure status.
Service-company reports	Jobs received/assigned, own vs outsourced calls, engineer productivity, earnings, TAT and quality.
Engineer reports	Own assignments, Day Start, completed/approved calls, rejected/repeat jobs, recharge eligibility, earnings and ratings.
Admin MIS	Company-wise/city-wise work volume, warranty, SLA, payout, quality, disputes, partner capacity and P&L.;
Notifications	New service request, assignment, acceptance deadline, visit/closure update, OTP, eFSR approval, payment and settlement status.
AI complaint alerts	Call failure, missing SR number, expected TAT, follow-up due, escalation and warranty-expiry reminder.
Audit logs	Lead/service ownership, assignment, override, rate-card snapshot, closure approval, payout decision and sensitive data access.

14 | Backend, Security & Multi-Company Data Separation

• Centralized backend/API and database for all platform roles and modules.

• Role-based permissions for OEM, vendor owner, engineer, customer and Servoshakti administrator.

• Strict company-wise data separation: users only see the records their role and company are authorized to access.

• Secure storage and controlled access for KYC, invoices, product passports, photos, service reports, transcripts and recordings.

• Audit trails for important service, dispatch, AI-call, payment and administrative actions.

• Backup, retention, export and data-deletion processes must be defined before production.

• API-ready architecture for AI complaint intake, telephony/voice, messaging, maps/GPS, payment and external CRM/service integrations.

• AI calling, recording, transcription, three-way bridge and automated attendance/payment verification depend on approved external providers and their technical capabilities.

■ DATA GOVERNANCE

Client-owned domain, hosting, database/API accounts and repository access should be specified in the final development contract. Define data export, backup frequency, retention, deletion and handover responsibilities before go-live.

15 | Deliverables & Acceptance Checklist

DELIVERABLE	ACCEPTANCE CHECK
OEM / Manufacturer Panel	Product and warranty setup, authorized vendor mapping, service requests, TAT/SLA, closure review and MIS.
Vendor / Service Company Panel	Company/KYC profile, engineer management, local assignment, outside-location partner requests and own-vs-outsourced visibility.
Engineer Mobile App / Tracker	Day Start required, automatic 11:59 PM IST close, own-data visibility, GPS, evidence, eFSR and approved-call/payment status.
Customer / Product Passport	Invoice, serial/model, purchase/warranty details, service history, complaint tracking and closure confirmation.
Dispatch Engine	Four-level priority, certification/skill/availability checks, configurable radius and acceptance timer, automatic reassignment and audit trail.
Rate Card & Settlement	Company-specific rates, job type, warranty status, distance slabs, separate engineer/vendor payout, platform fee and company MIS.
Incentive / Recharge	5 approved calls/month eligibility, 28-day recharge flag, configurable timing and inactive/failed/repeat call rules.
AI Complaint Assistant — Phase 1B	AI intake/summary, customer confirmation, brand call, SR/TAT capture, human fallback, consent-based transcript/recording, retry and escalation.
QA / UAT / Handover	Test scenarios, client UAT, issue log, production handover, admin training and agreed documentation.

16 | Implementation Phases

PHASE	SCOPE
Phase 1 — FieldForce Network	OEM, vendor/service company, engineer app/tracker, customer/product passport, work orders, warranty, dispatch, GPS/evidence, eFSR, approvals, rate cards, payout rules, reports and multi-company security.
Phase 1B — AI Complaint Assistant	AI complaint intake, product-linked complaint summary, customer confirmation, outbound brand customer-care call, SR/TAT capture, live human handoff where supported, transcripts/recording subject to consent, retries and follow-ups.
AI-ready foundation in Phase 1	Create product passport and complaint/SR data model, link service requests to customer/product, and design APIs/events so AI calling can be integrated later without redesigning the entire core platform.

✓ SCOPE BOUNDARY

This document is a functional scope of work and contains no development-price or commercial quotation. Final implementation priorities and external integrations should be confirmed in writing before development starts.

17 | Developer Contract & Handover Requirements

• Complete source code ownership and rights for the commissioned platform must be documented for Servoshakti.

• Hosting, domain, database, API provider accounts and production credentials should be created in or transferred to client-controlled ownership wherever feasible.

• Provide repository access, admin credentials, deployment instructions, environment configuration and technical documentation.

• Specify whether Android/iOS publishing and web deployment are included in the final delivery scope.

• List third-party APIs and define which provider charges are outside the development scope.

• Document maintenance/support period, response expectations, bug-fix warranty and exclusions in the contract.

• Define UAT/testing window, acceptance criteria, defect severity process and sign-off procedure.

• Define backup frequency, data export format, security review, data retention/deletion and vendor-exit handover.

• New features and changes to approved requirements must follow a written change-request process.

• If a developer/vendor stops providing service, client must receive the agreed source code, data export, credentials and handover materials.
